

Artificial Intelligence and IoT to monitor road conditions, detect incidences and provide **accurate information about the condition of the road infrastructure**

The **automated traffic sign inspection service** regularly supervises the correct state of the vertical signage inventory.

The application for **road surface irregularities** enables the early detection of potholes, deformed expansion joints... monitors their evolution, and analyses the impact of irregularities in the vehicles .

The **video** application, based on geofencing, gathers evidence of the road infrastructure condition to verify any variation.
